INTRODUCTION
Thank you for selecting the Tsurumi SQ Submersible Stainless Steel Wastewater Pumps. This equipment should not be used for applications other than those listed in this manual. Failure to observe this precaution may lead to a malfunction or an accident. In the event of a malfunction or an accident, the manufacturer will not assume any liability. After reading this Operation Manual, keep it in a location that is easily accessible, so that it can be referred to whenever information is needed while operating the equipment.

TSURUMI MANUFACTURING CO., LTD.
BE SURE TO READ FOR YOUR SAFETY

Be sure to thoroughly read and understand the SAFETY PRECAUTIONS given in this section before using the equipment in order to operate the equipment correctly. The precautionary measures described in this section are intended to prevent danger or damage to you or to others. The contents of this manual that could possibly be performed improperly are classified into two categories: WARNING, and CAUTION. The categories indicate the extent of possible damage or the urgency of the precaution. Note however, that what is included under CAUTION may at times lead to a more serious problem. In either case, the categories pertain to safety-related items, and as such, must be observed carefully.

- WARNING: Operating the equipment improperly by failing to observe this precaution may possibly lead to death or injury to humans.
- CAUTION: Operating the equipment improperly by failing to observe this precaution may possibly cause injury to humans and other physical damage.
- NOTE: Gives information that does not fall in the WARNING or CAUTION categories.

Explanation of Symbols:
- The △ mark indicates a WARNING or CAUTION item. The symbol inside the mark describes the precaution in more detail ("electrical shock", in the case of the example on the left).
- The ○ mark indicates a prohibited action. The symbol inside the mark, or a notation in the vicinity of the mark describes the precaution in more detail ("disassembly prohibited", in the case of the example on the left).
- The ● mark indicates an action that must be taken, or instructs how to perform a task. The symbol inside the mark describes the precaution in more detail ("provide ground work", in the case of the example on the left).

PRECAUTIONS TO THE PRODUCT SPECIFICATIONS

- WARNING

Do not operate the product under any conditions other than those for which it is specified. Failure to observe the precaution can lead to electrical leakage, electrical shock, fire, water overflow or other problems.

PRECAUTIONS DURING TRANSPORT AND INSTALLATION

- WARNING

<table>
<thead>
<tr>
<th>Use an appropriate lifting equipment to lift the unit. Improper lifting may result in the fall of the product which could cause damage of the product or human injury.</th>
<th>Install the product properly in accordance with this instruction manual. Improper installation may result in electrical leakage, electrical shock, fire, water leakage, or injury.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electrical wiring should be performed in accordance with all applicable regulations in your country. Absolutely provide a dedicated earth leakage circuit breaker and a thermal overload relay suitable for the product (available on the market). Imperfect wiring or improper protective equipment can lead to electrical leakage, fire, or explosion in the worst case.</td>
<td>Provide a secure grounding dedicated for the product. Never fail to provide an earth leakage circuit breaker and a thermal overload relay in your starter or control panel (Both available on the market). If an electrical leakage occurs by due to a product failure, it may cause electrical shock.</td>
</tr>
<tr>
<td>Use a power outlet that has a sufficient rating and has been exclusively provided for the pump. If the power outlet is shared with other equipment, it can lead to an abnormal heat of the outlet and can cause fire as a result.</td>
<td></td>
</tr>
</tbody>
</table>
## PRECAUTIONS DURING TEST OPERATION AND OPERATION

### CAUTION
- Be sure to provide a ground wire securely. Do not connect the ground wire to a gas pipe, water pipe, lightening rod, or telephone ground wire. *Improper grounding could cause electrical shock.*
- Prevent a metallic object or dust from sticking to the power plug. *Adhesion of foreign object to the plug could cause electrical shock, short-circuit, or fire.*
- Do not scratch, fold, twist, make alterations, or bundle the cable, or use it as a lifting device. *The cable may be damaged, which may cause electrical leakage, short-circuit, electrical shock, or fire.*
- Do not use the cabtyre cable, power plug, or power outlet if it is damaged or it is not closely fitted. Connect every conductor of the cabtyre cable securely to the terminals. *Failure to observe this can lead to electrical shock, short-circuit, or fire.*
- Install the discharge pipe securely so that no water leakage may occur. In addition, it is suggested to provide a stand-by pump in case of flooding. *Failure to do so may result in damage to nearby walls, floors, and other equipment.*
- This pump is neither dust-proof nor explosion-proof. Do not use it at a dusty place or at a place where toxic, corrosive or explosive gas is present. *Use in such places could cause fire or explosion.*

### WARNING
- Never try to operate the pump if somebody is present in the pump sump. *If an electrical leakage occurs, it can cause electrical shock.*
- Never start the pump while it is suspended, as the unit may jerk and could lead to injury.
- When changing power connection is needed to correct the direction of rotation, be sure to turn off the power supply (earth leakage circuit breaker, etc.), and perform the work after making sure that the impeller has stopped completely. *Failure to do so may lead to electrical shock, short-circuit, or injury.*
- When inspecting the pump, be sure to turn off the power supply (earth leakage circuit breaker, etc.) so that the pump may not start accidentally. *Failure to do so may lead to a serious accident.*

### CAUTION
- Do not operate the product under any voltage other than described on the nameplate with the voltage tolerance limit within ±5%. If it is operated with a generator, it is strongly suggested not to operate other equipment with the same generator. *Failure to observe this caution may cause malfunction and breakdown of the product, which may lead to electrical leakage or electrical shock.*
- Do not touch the product with bare hands during or immediate after the operation, as the product may become very hot during operation. *Failure to observe this caution may lead to be burned.*
- Do not use the pump for oil, sea water, or strong acid. *Use for these liquid may result in the damage of the pump.*
- Do not run the product dry or operate it with its gate valve closed, as doing so will damage the product, which may lead to electrical leakage or electrical shock.

---

For oil, sea water, or strong acid.
### CAUTION

- Do not use the product for hot or warm liquid over 40°C, as doing so will damage the product, which may lead to electrical leakage or electrical shock.
- Do not allow foreign object (pin, wire, etc.) to enter the suction inlet of the pump. Failure to observe this caution could cause it to malfunction or to operate abnormally, which may lead to electrical leakage or electrical shock.
- When the product will not be used for an extended period, be sure to turn off the power supply (earth leakage circuit breaker, etc.). Deterioration of the insulation may lead to electrical leakage, electrical shock, or fire.

### PRECAUTIONS DURING MAINTENANCE AND INSPECTION

### WARNING

- Absolutely turn off the power supply or disconnect the plug before starting maintenance or inspection. Do not work with wet hands. Failure to observe these cautions may lead to electrical shock or injury.
- In case any abnormality (excessive vibration, unusual noise or odor) is found in the operation, turn the power off immediately and consult with the dealer where it was purchased or Tsurumi representative. Continuing to operate the product under abnormal conditions may result in electrical shock, fire, or water leakage.
- Do not disassemble or repair any parts other than those designated in the operation manual. If repairs are necessary in any other than the designated parts, consult with the dealer where it was purchased or Tsurumi representative. Improper repairs can result in electrical leakage, electrical shock, fire, or water leakage.

### CAUTION

- After reassembly, always perform a test operation before resuming use of the product. Improper assembly can result in electrical leakage, electrical shock, fire, or water leakage.

### PRECAUTION TO POWER OUTAGE

### WARNING

- In case of power outage, turn off the power supply. The product will resume operation when the power is restored, which presents serious danger to people in the vicinity.

### OTHER PRECAUTION

### CAUTION

- Never use the product for potable water. It may present a danger to human health.
**PART NAMES**

**Strainer Stand**

---

**PRIOR TO OPERATION**

After unpacking, verify the contents.

**Product Inspection**

Inspect the product for damage during shipment, and make sure all bolts and nuts are tightened properly.

**Specification Check**

Check the nameplate of the unit to verify that it is the product that you have ordered. Pay particular attention to its voltage and frequency specifications.

**Example of nameplate**

![Nameplate Image]

**Note:** If you discover any damage or discrepancy, please contact the Tsurumi dealer from whom you purchased the product or the nearest Tsurumi representative office.

**Accessory Check**

Verify that all accessory items are included in the package.

- **Operation Manual** ............................ 1

**Note:** If you discover any damage or discrepancy in the product, please contact the dealer where this equipment was purchased or the Tsurumi sales office in your area.
**Product Specifications**

**CAUTION** Do not operate this product under any conditions other than those that have been specified. Failure to observe this precaution can lead to electrical shock, electrical leakage, fire, water leakage or other problems.

**4 INSTALLATION**

**CAUTION** • Do not use the pump for pumping liquids other than water, such as oil, salt water, or organic solvents. • Use with a power supply voltage tolerance within ±5% of the rated voltage. • The water temperature for operating the pump should be between 0 ~ 40℃. Failure to observe the precautions given above could cause the pump to malfunction, which may lead to current leakage or electrical shock.

**Note:** To use the pump for a special solution, contact the dealer where it was purchased, or the Tsurumi sales office in your area.

**Maximum Allowable Pressure**

**CAUTION** Do not operate the pump in an area that is exposed to a water pressure that exceeds the values given below.

| Maximum Allowable Pressure | 0.2MPa (2kgf/cm²) - discharge pressure during use |

**Preparation for Installation**

**Single-phase power supply:**
Use a megger to measure the resistance between the tip of the captive screw plug and the ground terminal to verify the insulation resistance of the motor. (This drawing shows a 2-pin plug type.)

**CAUTION** Beware that the power plug varies by country or region.

**Three-phase power supply:**
Use a megger to measure the resistance between each core of the captive screw cable and the (green) ground wire to verify the insulation resistance of the motor.

**Insulation resistance reference value**

**Note:** The insulation resistance reference value of 20MΩ minimum is based on a new or repaired pump. For reference values of a pump that has already been put into operation, refer to section "7. Maintenance and Inspection" of this manual.
Precautions During Installation

⚠️ WARNING When installing the pump, be mindful of the pump’s center of gravity and weight. If the pump is not suspended properly, the pump may fall and break, which may lead to injury.

⚠️ CAUTION When installing or moving the pump, never suspend the pump by the cabtyre cable. Doing so will damage the cable, which may cause a current leakage, electrical shock, or fire.

Refer to the installation examples illustrated below and pay attention to the points described below to install the pump.

⚠️ CAUTION During piping work if the welding sparks, paint, or concrete come in contact with the pump, they could cause the pump to malfunction, which may lead to current leakage or electrical shock.

1. When transporting or installing the pump, do not kink the cabtyre cable or use it in place of a rope.

2. With the cabtyre cable lifted slightly, secure it to the hook (a hook must be prepared in advance by placing it on the frame of a manhole or the like).

⚠️ CAUTION Do not operate the pump with the cabtyre cable dangling. Failure to observe this precaution may cause the cabtyre cable to become wrapped around the impeller, which could cut the cable, break the impeller, or cause flooding, which may lead to current leakage or electrical shock.

3. Install the pump on a horizontal and rigid surface such as concrete, in an area that is free from turbulence and does not cause the pump to take air in.

4. The area near the inlet of a water tank is susceptible to turbulence or allows the pump to take air in; therefore, place the pump and the float switch away from the inlet or install a baffle plate.

5. Properly perform piping work so as not to create any air pockets in the middle of piping.

⚠️ CAUTION With automatic control, the sewage water in the pipe could flow backwards, causing the water surface control to react immediately. As a result, the pump will operate ON/OFF repeatedly, which could cause the pump to malfunction.

6. Install a non-return valve if the pump tank is deep, or if the vertical head or the lateral distance is long.

Attaching a Rope to Suspend the Pump

Refer to the illustration on the right in order to suspend the pump by a rope.

⚠️ CAUTION Make sure that the rope does not become twisted during installation. Failure to observe this precaution could cause the rope to break and the pump to fall and break, which could lead to injury.
Connecting a Hose

(1) When a hose is used, attach the hose to the hose coupling as far as it will go, then fasten it securely with a hose band.

(2) Operate the pump in a location that has a sufficient water level and collects water easily.

Note: For the water level required for operating the pump, refer to the external dimension drawing, which is provided separately. Extend the end of the hose (discharge side) above the water surface. If the end of the hose is submerged in water, it may cause the water to flow back when the pump has been stopped. Conversely, if the end of the hose is located at a level that is lower than the source water surface, water may continue to flow out even after the pump has been stopped.

(3) Route the hose as straight as possible. Excessive bending of the hose could obstruct the flow of water, reduce the pumping volume, or clog the pump with mud, thus disabling the pumping function. If the hose is kinked at its base, it will create air pockets in the pump, making the pump operate dry. To prevent this from occurring, straighten the bend while operating the pump.

CAUTION If the pump draws in a large amount of mud, it could cause the pump to wear prematurely and lead to a malfunction, current leakage, and electrical shock.

(4) Operate the pump upright. If there is the likelihood of the pump drawing in excess mud, place a concrete block under the pump.

Installing the Float
(automatic type only)

Insert the float pipe into the holder and use a Phillips screwdriver to tighten the set screws. Adjust the floats as follows:

(1) To set the starting and stopping water levels, loosen the pipe set screw and adjust the height of the starting float pipe and the stopping float pipe.

(2) After completing the adjustment, tighten the set screws to secure both the starting float pipe and the stopping float pipe.

* To prevent improper operation, face each float outward.

Adjusting the start float to set the starting water level as desired:

Make sure that the float lead wire length L is 40mm. Failure to observe this precaution could cause the pump to operate improperly.
5 ELECTRICAL WIRING

Electrical Wiring Work

WARNING • All electrical work must be performed by an authorized electrician, in compliance with local electrical equipment standards and internal wiring codes. Never allow an unauthorized person to perform electrical work because it is not only against the law, but it can also be extremely dangerous.
• Improper wiring can lead to current leakage, electrical shock, or fire.
• Absolutely provide a dedicated earth leakage circuit breaker and a thermal overload relay suitable for the pump (available on the market). Failure to follow this warning can cause electrical shock or explosion when the product fails or an electrical leakage occurs.

Operate well within the capacity of the power supply and wiring.

Grounding

WARNING Be sure to install the ground wire securely. Failure to observe this precaution could damage the pump and cause current leakage, which may lead to electrical shock.

CAUTION Do not connect the ground wire to a gas pipe, water pipe, lightning rod, or telephone ground wire. Improper grounding could cause electrical shock.

Connecting the Power Plug

WARNING Before inserting the power plug or connecting the wires to the terminal board, make sure that the power supply (i.e. circuit breaker) is properly disconnected. Failure to do so may lead to electrical shock, short, or injury caused by the unintended starting of the pump.

CAUTION Do not use damaged cabletyre cables, power plugs, or loose power outlets. Failure to observe this precaution could lead to electrical shock, short circuit, or fire.

Follow the diagram on the right to connect the power.

When using a three-prong grounded plug, connect as shown in the drawing.

CAUTION Be sure to use a dedicated power supply with a ground leakage circuit breaker.

(This drawing shows a 2-pin plug type.)

CAUTION Beware that the power plug varies by country or region.

Note: The shape of the plug may differ from that shown in the illustration.

When a single-phase power source is used, connect the leads to the control panel terminals as shown in the diagram, making sure they do not become twisted together.

When a three-phase power source is used, connect the leads to the control panel terminals as shown in the diagram, making sure they do not become twisted together.
Motor Protector

The pump is equipped with a built-in motor protector (miniature protector, circle thermal protector). If a current overload or overheating occurs under the symptoms given below, the pump will stop automatically to protect the motor regardless of the water level at the time of operation.

- Extreme fluctuation of power supply voltage
- Pump operated under overload condition
- Pump operated at open phase or binding condition

Note: After the motor protector has tripped, the motor automatically resumes its operation. Therefore, make sure to disconnect the cable from the terminal board or the power outlet, and eliminate the cause of the problem.

Do not operate the pump at unusually low head, or with the impeller clogged with debris. Doing so will not only prevent the pump from attaining its full potential, but may also generate abnormal noise and vibration and damage the pump.

Electrical Circuit Diagrams

Non-Automatic Circuit

Direct-on-line
Power Supply: Three-Phase

Automatic Operation Circuit
Power Supply: Single-Phase
6 OPERATION

Prior to Operation

(1) Once again, check the nameplate of the pump to verify that its voltage and frequency are correct.

⚠️ CAUTION Improper voltage and frequency of the power supply will prevent the pump from attaining its full potential, and may also damage the pump.

Note: Verify the specs on the pump’s nameplate.

(2) Check the wiring, power supply voltage, the capacity of the ground leakage circuit breaker, and the insulation resistance of the motor.

- Insulation resistance reference value = 20MΩ minimum

Note: The insulation resistance reference value of 20MΩ minimum is based on a new or repaired pump. For reference values of a pump that has already been put into operation, refer to section "7. Maintenance and Inspection".

(3) Adjust the setting of the thermal relay (i.e. 3E relay) to the pump’s rated current.

Note: Verify the rated current on the pump’s nameplate.

6-1 NON-AUTOMATIC OPERATION

Trial Operation

⚠️ WARNING Never start the pump while it is suspended, as the pump may jerk and cause a serious accident involving injury.

(1) Operate the pump for a short time (1 to 2 seconds) and verify the direction of the rotation of the impeller. Observe the pump unit from above, and if its recoil is in the counterclockwise direction, the direction of its rotation is correct.

⚠️ CAUTION Make sure to check the pump’s direction of rotation with the pump exposed to the atmosphere. Operating the pump in reverse while it is submerged in water will damage the pump, which may lead to current leakage and electrical shock.

(2) To reverse the rotation, the following countermeasures must be taken.

⚠️ WARNING Before changing the connections for reverse rotation, make sure that the power supply (i.e. circuit breaker) is properly disconnected and that the impeller has stopped completely. Failure to observe this may lead to electrical shock, short, or injury.

**COUNTERMEASURE**

Direct-on-line starting
Interchange any two of the three wires designated U, V, and W, respectively.

(3) Connect the pump to the pipe and submerge it in water.

(4) Operate the pump for a short time (3 to 10 minutes) and perform the following checks:

Using an AC ammeter (clamp), measure the operating current at the phases U, V, and W that are connected to the terminal board.

**COUNTERMEASURE**

Because an overload condition may be present at the pump motor if the operating current exceeds the rated current, follow the instructions in section "4. Installation" to operate the pump in the correct manner.
Using an AC voltmeter (tester), measure the voltage at the terminal board.
- Power supply voltage tolerance = within ± 5% of the rated voltage

**COUNTERMEASURE**

If the power supply voltage deviates from the variation value, the cause of the deviation may be the capacity of the power supply or the extension cable that is used. Refer to section "5. Electrical Wiring" to operate the pump in the correct manner.

**CAUTION**

In case the pump exhibits an abnormal condition (such as a considerable amount of vibration, noise, or smell), disconnect the power supply immediately and contact the dealer where you purchased the equipment, or Tsurumi's sales office in your area. If the pump continues to be used in the abnormal state, it may cause current leakage, electrical shock, or fire.

(5) Proceed with the normal operation if no abnormal conditions are found during the trial operation.

**Operation**

**WARNING**

The pump unit may be extremely hot during operation. To prevent burns, do not touch the pump unit with bare hands during or after the operation.

Pay attention to the water level during the pump operation. The pump will become damaged if it is allowed to operate dry.

Due to an overload operation or a pump malfunction, if the motor protector trips to stop the pump, make sure to eliminate the cause of the problem before restarting.

To operate a submersible pump (including automatic operation), set the water level so that the pump will operate about 10 times per hour.

**Note:** A large amount of amperage flows when a submersible pump is started, causing the temperature of its windings to rise rapidly. Beware that a frequent stop-and-go operation of the pump will accelerate the deterioration of the insulation of the motor windings and thus affect the use life of the motor.

**Operating Water Level**

**CAUTION**

Do not operate the pump at the lowest water level longer than 30 minutes, as it could damage the pump, causing current leakage and electrical shock (15 minutes maximum on the models with 1.5kW power output). For details on the lowest water level, refer to the dimension drawing, which is provided separately.

**6-2 Automatic Operation**

**Trial Operation**

Equipped with floats to detect the water level and an internal control circuit, the automatic type (SQA) pump can perform an automatic drainage operation alone by merely connecting its cable to a power supply.

Connect the power and perform a trial operation as follows:

1. Direct all the floats downward.
2. First raise the (red) stop float, then the (yellow) start float. This will cause the pump to start.
3. Next, return the (yellow) start float, and then the (red) stop float to their original positions. This will cause the pump to stop.
4. Perform steps (2) and (3) consecutively two or more times to verify the operation.

**Note:** Allow the pump to operate a minimum of 2 seconds for each trial operation. The trial operation must be completed within 1 minute.

**CAUTION**

In case the pump exhibits an abnormal condition (such as a considerable amount of vibration, noise, or smell), disconnect the power supply immediately and contact the dealer where you purchased the equipment, or Tsurumi's sales office in your area. If the pump continues to be used in the abnormal state, it may cause current leakage, electrical shock, or fire.
Regular maintenance and inspection are indispensable to maintaining the pump's performance. If the pump behaves differently from its normal operating condition, refer to section "9. Troubleshooting" and take appropriate measures at an early stage. We also recommend that you have a spare pump on hand for an emergency.

Prior to Inspection

WARNING Make sure that the power supply (i.e. circuit breaker) is disconnected and disconnect the cabtyre cable from the power outlet or remove it from the terminal board. Failure to do so may cause electrical shock or unintended starting of the pump, which may lead to serious accidents.

(1) Washing the Pump
Remove any debris attached to the pump's outer surface, and wash the pump with tap water. Pay particular attention to the impeller area, and completely remove any debris from the impeller.

(2) Inspecting the Pump Exterior
Verify that there is no damage, and that the bolts and nuts have not loosened.

Note: If the pump must be disassembled for repair due to damage or loose bolts or nuts, contact the dealer where it was purchased, or the Tsurumi sales office in your area.

</tr>
<tr>
<td></td>
<td>[NOTE] To overhaul the pump, contact the dealer where it was purchased, or the Tsurumi sales office in your area.</td>
</tr>
</tbody>
</table>

Note: Refer to section "Oil Inspection and Change Procedures" below for further detail.

Note: In case the pumping liquid contains oil, paint, or slurry, it may cause the swelling of cable jacket or abrasion of the mechanical seal's sealing face, which will result in the pump fault, it is strongly recommended to inspect earlier.
Storage

If the pump will not be operated for a long period of time, pull the pump up, wash the pump, allow it to dry, and store it indoors.

Note: For reinstallation, be sure to perform a trial operation before putting the pump into operation.

If the pump remains immersed in water, operate it on a regular basis (i.e. once a week).

Oil Inspection and Changing Procedures

⚠️ CAUTION The pump must be turned upside down to remove the oil plug, which could cause the pump to fall. Take appropriate measures to prevent the pump from falling down, such as securing it in place.

1. Remove the hexagonal nut and the flat washer from the bottom of the strainer stand and remove the strainer stand from the pump.
2. Remove the stud bolts from the bottom of the suction cover, and remove the suction cover from the pump.
3. Using a box wrench, remove the impeller nut and spring washer; then remove the impeller from the main shaft.
4. Remove the oil plug and take out a small amount of oil. The oil can be extracted by tilting the pump so that the oil plug faces downward. If the oil appears milky or intermixed with water, a likely cause is a defective shaft sealing device (i.e. mechanical seal), which requires that the pump be disassembled and repaired.

Changing Oil
Remove the oil plug and drain the oil completely. Pour a specified volume of oil into the oil filler inlet.

Note: The drained oil must be disposed of properly to prevent it from being released into the sewer or rivers. The packing or the O-ring for the oil plug must be replaced with a new part at each oil inspection and change.
Prior to Disassembly and Reassembly

**WARNING** Before disassembling and reassembling the pump, be sure that the power supply (i.e. circuit breaker) is disconnected, and remove the cabtyre cable from the outlet or the terminal board. Do not connect or disconnect the power plug with a wet hand, in order to prevent electrical shock. Do not perform an activation test (to check the rotation of the impeller) during disassembly and reassembly. Failure to observe this precaution could lead to a serious accident, including injury.

This section explains the disassembly and reassembly processes that are involved up to the replacement of the impeller itself. Operations involving the disassembly and reassembly of the sealing portion (i.e. mechanical seal) and of the motor require a specialized facility including vacuum and electrical test equipment. For these operations, contact the dealer where this equipment was purchased, or the Tsurumi sales office in your area.

### Disassembly Procedure

1. Remove the hexagonal nut and the flat washer from the bottom of the strainer stand and remove the strainer stand from the pump.

2. Remove the stud bolts from the bottom of the suction cover, and remove the suction cover from the pump.

3. Using a box wrench, remove the impeller nut and spring washer; then remove the impeller from the main shaft.

### Disassembly Diagram

- Packing
- Suction Cover
- Stud Bolt
- Spring Washer
- Impeller Nut
- Strainer Stand
- Plate Washer
- Hex. Nut
- Packing
- Oil Plug
- Impeller

### Reassembly Procedure

Observe the precautions given below and reassemble the unit in the reverse order of disassembly.

**Note:** After completing the reassembly, make sure to fill the pump with the specified amount of oil. The packings must be replaced with a new part. If any part is worn or damaged, make sure to replace it with a new part.

After reinstalling the impeller or the suction cover, check that the impeller rotates smoothly and that there is no interference between it and the suction cover.
WARNING To prevent serious accidents, disconnect the power supply before inspecting the pump.

Read this Operation Manual carefully before requesting repair. After re-inspecting the pump, if it does not operate normally, contact the dealer where this equipment was purchased, or the Tsurumi sales office in your area.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pump fails to start; or, starts but stops immediately.</td>
<td>(1) No proper power is supplied (i.e. power outage). (2) Malfunction in automatic control (control panel) (3) Foreign matter is wedged in the impeller, causing the motor protector to trip. (4) Malfunction in start float.</td>
<td>(1) Contact the electric power company or an electrical repair shop. (2) Have the cause investigated and repaired by a specialist. (3) Inspect the pump and remove the debris. (4) Remove obstacles and check the operation of the stop float.</td>
</tr>
<tr>
<td>Pump starts but stops after a certain length of time.</td>
<td>(1) The pump has been operating for a long time while being exposed to air, causing the motor protector to trip. (2) The movement of the stop float is obstructed, causing the start float alone to perform the start and stop operations.</td>
<td>(1) After resuming operation, switch to operation of approximately once every 30 minutes. (2) Remove obstacles and check the operation of the stop float.</td>
</tr>
<tr>
<td>The power supply circuit breaker trips.</td>
<td>(1) The equipment is not matched to the pump specifications or the equipment rating is improperly set. (2) Malfunction of motor (seizure or water leakage). (3) A 50Hz unit is used at 60Hz.</td>
<td>(1) Replace the equipment with the correct specification or set it to the correct setting. (2) Repair or replace. (3) Check the nameplate and replace the pump.</td>
</tr>
<tr>
<td>Pump operates but does not pump water.</td>
<td>(1) An air lock occurred in the pump. (2) The pump or the piping is blocked. (3) The piping is partially blocked or the valve is operating improperly. (4) The motor rotates in reverse.</td>
<td>(1) Stop momentarily and then restart; or, clean the air release valve. (2) Remove the blockage. (3) Remove the blockage, or repair or replace the valve. (4) Change the power supply connection.</td>
</tr>
<tr>
<td>The pumping volume is low.</td>
<td>(1) The impeller or the pump casing is significantly worn. (2) There is a great piping loss. (3) A 60Hz pump is used at 50Hz. (4) The motor rotates in reverse.</td>
<td>(1) Repair or replace the affected part. (2) Re-examine the work plan. (3) Check the nameplate and replace the pump. (4) Change the power supply connection.</td>
</tr>
<tr>
<td>Pump generates vibration or noise.</td>
<td>(1) The pipe support is loose. (2) Motor bearings are damaged. (3) Valve is tightly closed.</td>
<td>(1) Secure the pipe support. (2) Replace the bearings. (3) Adjust the valve to the proper opening.</td>
</tr>
<tr>
<td>The pump does not stop automatically.</td>
<td>(1) The movement of the start and stop floats is obstructed. The switch in a float is faulty. (2) The water level of the stop float is set lower than the pump’s minimum possible operating water level.</td>
<td>(1) Remove the blockage. Or, replace the part. (2) Set the water level of the stopping float at the specified level or higher than the pump’s minimum possible operating water level. For details on the stopping water level, refer to the dimension drawing that is provided separately.</td>
</tr>
